Traditional Door Alarms

Arm and Disarm
With Access Control

Access Control:

Access control allows you to control who has access to your facility. Keys and locks also allow you to secure your building, but when keys are lost or stolen, the inconvenience and expense of changing locks and re-issuing keys can be considerable. Keys may also be copied, creating even more security risks. Customers are demanding more security than just a lock on their unit door.

Access control also allows you to secure the facility remotely, or automatically. Your manager does not need to close and lock gates and building doors. This can now be done remotely.

Our access control consists of **three required components**. These are **software, controller, and keypad**. We have several options for upgrades, but these three components are needed for a complete system. In lieu of a keypad, we do offer fingerprint readers.

Our systems require CAT5 wire to the keypads. Intercoms and camera options may require additional wiring. They are low voltage systems that can be installed by any local electrician. We gladly offer technical support, to you or your contractor, to aid in the installation of our product.

We believe in our products. Our keypads have a five year warranty. Our standard warranty for other product is one year. Our live tech support offers solutions to any issues you may encounter.

Let us help you find the solution that works best for you.

Traditional Individual Door Alarms:

Today's customers expect the highest level of security. It has become a part of their daily lives, for their safety, and the safety of their belongings. Security is the number one thing customers look for in a storage facility. Cutting corners on your security design, for a new facility, will provide you with a less marketable product.

The most effective way to secure your customers property is with individual door alarms. Thieves are getting creative. They are renting units, and breaking into other units while they are in your facility. They will cut locks, and replace them with their own. Without individual door alarms, you don't even know there is a problem until your customer comes in and lets you know they can't access their unit. When you open it, all the valuables are missing!

Individual door alarms help! When your customer uses their code to enter the facility, the gate is opened, and their unit is disarmed. If they try to access another unit, the alarm will sound, and alert you! There is nothing passive about an individual door alarm system.

Traditional individual door alarms are best installed during construction. This reduces cost and increases reliability.

Individual door alarms are becoming more popular as theft of storage units increase. They give you a safer facility and a marketing edge. Units with individual door alarms also demand higher rent.

Systems consist of door contacts, controller MUXs, power supplies, software and drawing.
